

APPLICATION NOTE

Monitoring by voltage

BEA Products to which this Information Sheet applies:

- ✓ ACTIV8 ONE ON
- ✓ IRIS ON
- ✓ ACTIV8 THREE ON
- ✓ 4SAFE M LINE
- ✓ 4SAFE M SQUARE

TIMING DIAGRAM

- 0** Presence Sensor in normal state (non-detection).
 - 1** Presence Sensor in detection state (target within the detection field).
 - 2** Monitoring Input in normal state.
 - 3** Presence Sensor recovering from detection state (target out of detection field) → before closing the door, the door controller initiates a test of the sensor and its wiring by un-powering the monitoring input of the sensor (log. L).
 - 4** The sensor recognizes the change of state of its monitoring input and verifies the internal state of the sensor. If the sensor is OK, it changes the state of the presence output to detection state.
 - 5** The door controller recognizes the change of state of the Presence Sensor output and can consider that the sensor as well as the wiring is OK. The controller then re-powers the monitoring input of the sensor (log. H).
 - 6** The sensor recognizes that the monitoring input has been turned back to normal state (log. H) and as a consequence, it turns the Presence Sensor output back to non-detection state.
 - 7** Presence Sensor output in normal state (non-detection).
 - 8** Monitoring input in normal state.
-
- t₀** Time during which the presence sensor is in detection state (time during which a target is in the detection field - or - the maximum presence detection time).
 - t₁** Delay imposed by the door controller before initiating a monitoring request (depends on reaction time of door controller)
 - t₂** Delay imposed by the sensor for internal check after receiving the monitoring request and changing the state of its presence detection output.
 - t₃** Delay imposed by the door controller to recognizing the answer of the sensor upon a monitoring request.
 - t₄** Delay imposed by the sensor to recognize the reception of the sensors answer and its reaction to turn the monitoring input back to default state.

The door controller should consider that delay **t₂** between issuing the monitoring request (**3**) and the response from the sensor (**4**) should not exceed 200ms.

Periodicity of the monitoring: - Before each dangerous movement (ex. door closing movement)
- Once per hour
